Monticello, Dec. 14, 1813.

I have had the pleasure, my dear Sir, of receiving your letter of Aug. 7, 1812, and with it a copy of your voyages for the observation of the Concolus at sea, which I have read with great satisfaction, and pray you to accept my thanks for them. I received at the same time your pamphlet on the Micrometers, a rock-crystal, the advantages of which you had shown to me in 1785 at Dr. Franklin's at Passy, on the telescope you gave him, which is now in my possession. The uses of this discovery at sea, as well as with land-armaments, are so many and great, that it is wonderful to me, that in a course of 30 years, it is not yet brought into general use, it is one of the remarkable proofs of the slowness with which improvements in the arts become advanced.

I am happy to learn that you are in the superintendence of the interests of manufactures. I shall rejoice to see them flourish everywhere, every nation enabled to furnish itself with what it has hitherto taken from England, and withdrawing from her their quota of the aliment of her thousand armed ships, and of her privacies on the ocean, of which they are the instruments, we shall certainly hereafter call on her for very little. Never has there been an instance of such rapidity in the establishments of manufactures; the capital of our former commerce being of necessity directed to that object. we have already, or shall certainly have in the course of another year, a million of spindles engaged in spinning, which are sufficient for clothing our eight millions of people, but they will still continue to multiply. We are setting the spinning machines into all our farm houses, for the clothing of our families. I work myself upwards; I have hundreds of spindles merely for our own domestic use. We raise wool enough for all our purposes; so much the less being necessary with our abundance of cotton, the race of Merino is very much multiplied and spread over all our states from here northward.

I give you these details because I know your partiality for M. l'Abbe Roydon.
The useful arts, and that you will see their importance in all their bearings, political and economical. I am glad to learn that you are showing us the way to supply ourselves with some of the most necessary tropical productions, and the better races, which we can all raise, promises to supplant the cane particularly, and to silence the demand for the inhuman species of labour employed in its culture and manipulation. Could you favor me with the details of the best process for the manufacture of sugar from the beet? I have the book of M. Pavonnerier, but that does not give us recipes of the process. Very much gratified by this occasion of recalling myself to your recollection, I tender you the assurance of my great esteem and respect.

Thomas Jefferson
